

Spring AI ETL Pipeline Example

This document serves as an example for demonstrating how to process a document through a pipeline in Spring AI. The pipeline includes steps like reading, splitting, and embedding a document.

Steps:

1. Read the document using `DocumentReader`.
2. Split the document into smaller parts using `TextSplitter`.
3. Process the parts further in the pipeline.

This is a sample document to validate if the text splitting and processing work correctly.
